

IMAGES OVERFLOWING?

Some of you might have noticed that the last image in the portfolio section seems to be overflowing by a few pixels:

Of course you are totally right! There's a piece of CSS I thought I had put in place that I totally forgot about (so it didn't make its way in the code and in the video recording).

Here's what you need to fix the issue:

```
.work figure > img {  
    width: 100%;  
}
```

The `.work` blocks are already correctly positioned. We just need to tell each image to conform its width to the horizontal width of its parent (the `figure` element) instead of using its original dimensions. The image height will automatically follow, to keep the correct aspect ratio.

Kudos to [Md. Rakibul](#) and [Jeremy](#) to bring it to my attention!
